

```
function getBookReview(ISBN, callback) {
  // Assuming you have a function to fetch the review from the database
  // or a separate database table for book reviews
  // Implement the database interaction based on your backend setup
  // For this example, we'll simulate a review retrieval
  setTimeout(() => {
    const review = "This book is great! Highly recommended.";
    callback(review);
  }, 1000); // Simulating a 1-second delay for fetching data
}

// Usage
const targetISBNForReview = "123456789";
getBookReview(targetISBNForReview, (review) => {
  console.log("Book Review:");
  console.log(review);
});
```
